

Working Prototype Known Problem Reports

rallyAI, 12/2/2019

User Functionality Calls:

Users can only predict on a subset of the S&P 500 companies:

- The database allows users to query by company name
- The input to our machine learning model is one argument
- Companies with two or more words in their name cannot be queried
- A list of ten companies have been trained

Users typing in "bad" inputs are handled by GraphQL:

- Any GraphQL server will automatically handle syntactical and validation errors and inform the client appropriately
- If you just mistype a query, you'll see an error popping up in the dedicated errors field in the response
